

Partnership protects the voyage to the cloud.

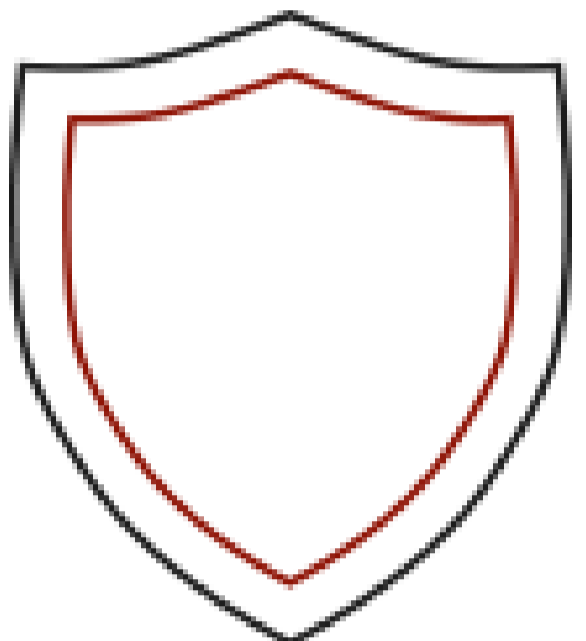

Organization for Economic Co-operation and Development

High-performance, hyperconverged solution brings backups back under control.

The IT Services division was protecting data in four isolated silos, based on data type.

Backups were *unwieldy* and *overly complicated*—and were not completing within the weekend backup window.

They needed streamlined and flexible data protection.

Backup storage capacity needed to increase more than 15 percent to support a growing data volume.

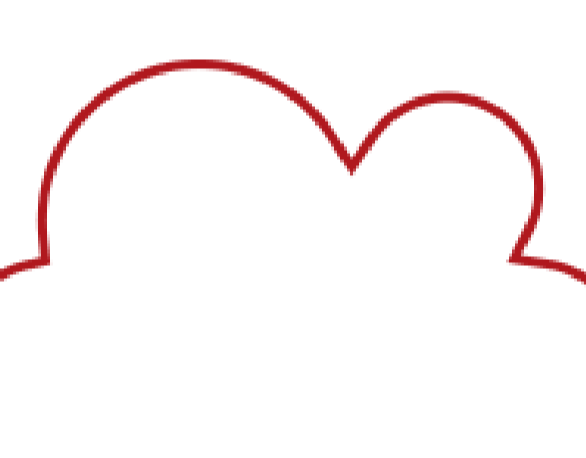

The OECD also requires quick turnaround for introducing new technology solutions in its Microsoft Hyper-V environment.

The OECD chose Veritas™ NetBackup™ Appliances.

OECD IT Services performed four-week comparative tests on appliances from several vendors.

Veritas NetBackup Appliances stood out for their performance, ability to scale, and simplified data protection management.

Now the organization is ready for its journey to the cloud.

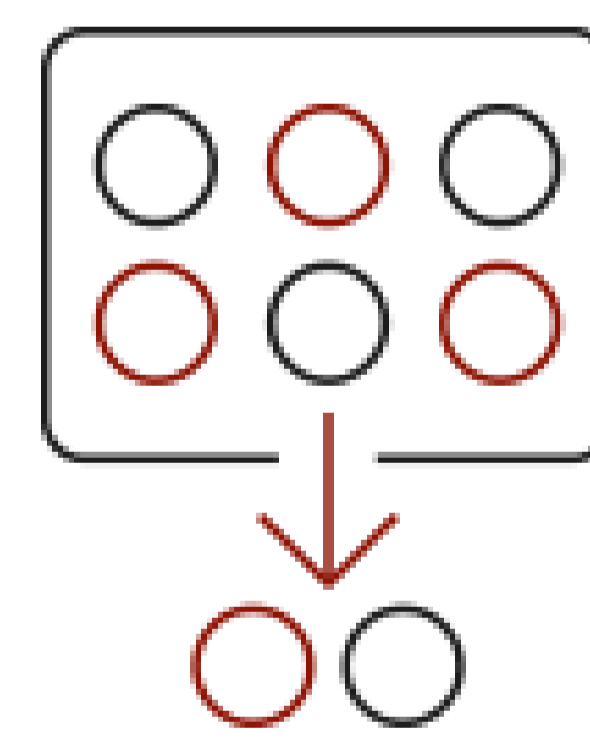

IT Services is also deploying Veritas NetBackup CloudCatalyst, a highly efficient deduplication technology that enables companies to use cost-efficient cloud storage in their data protection environment.

NetBackup CloudCatalyst will support the OECD's transition to a Microsoft Azure cloud environment.

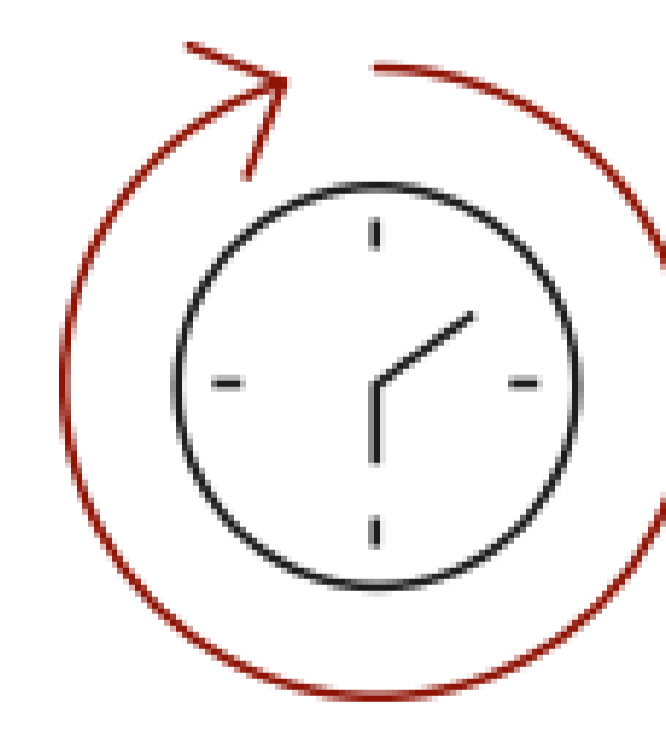

Hyperconvergence of hardware and software in one solution makes daily management of data protection *"enormously easier."*

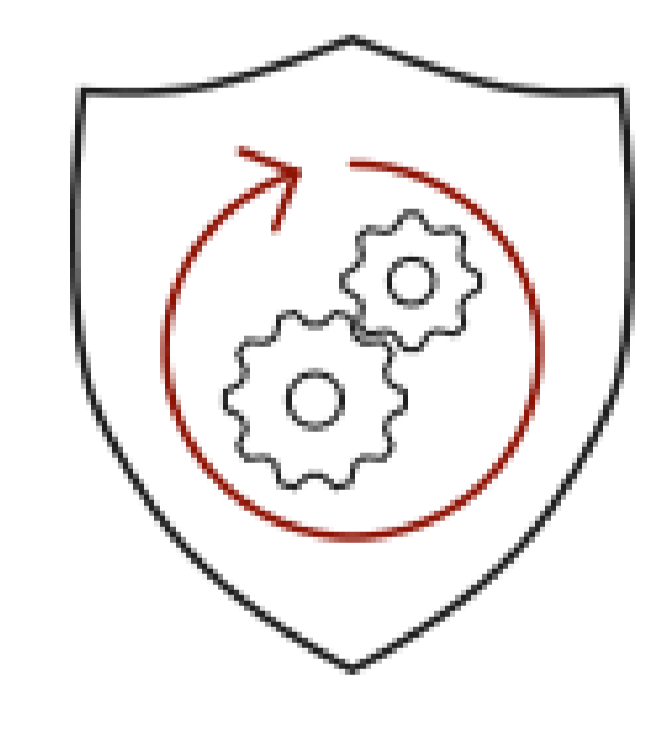

Veritas NetBackup™ Appliance

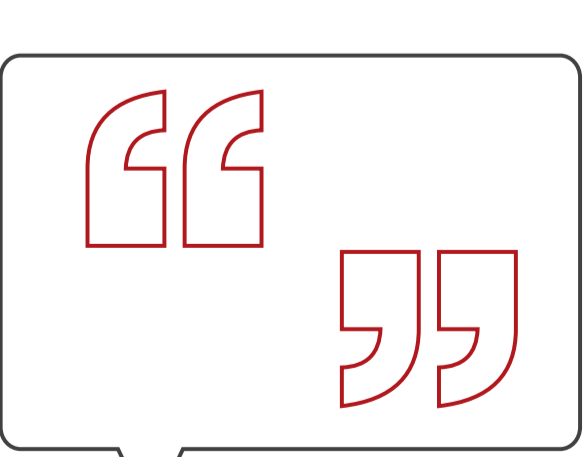

More than 15% increase in backup storage capacity, due to source deduplication.

Weekend backups now complete on-time due to faster speeds.

Streamlined backup management with a single backup pool and fewer backup policies.

"Veritas, as a true specialist in data governance and protection, will without a doubt be our partner of choice to accompany us in this fabulous, but perilous, voyage to the cloud."

— Frédéric Challa, Manager,
IT Service Infrastructure Division, OECD
