

# Veritas Alta™ Application Resiliency and Veritas Alta Shared Storage

Resiliency and Storage Management  
for Kubernetes

## Executive Summary

Containers have become a mainstream solution for building and running IT services that help businesses reduce management overhead and focus on delivering new innovations. With an increasing focus on cloud transformation and multi-cloud operations<sup>1</sup>, many organizations are considering cloud-based Kubernetes services to provide the advanced orchestration and management functionality needed to streamline container operations. However, Kubernetes and cloud-based Kubernetes services do not provide all the tools needed to manage stateful containerized applications that require enterprise-grade persistent storage and resiliency.

Veritas Alta Application Resiliency and Veritas Alta Shared Storage provide software-defined persistent storage and resiliency functionality designed to deliver an enterprise foundation for stateful applications running in Kubernetes environments. Today, more than half (55 percent) of organizations are actively using containers, and another 18 percent are in the discovery stage<sup>2</sup>. Veritas enables you to run your stateful containerized applications in the cloud with advanced features focused on three key principles:

- **Resiliency:** Enterprise-grade persistent storage that works with cloud-native storage services, with integrated disaster recovery capability to protect your containerized applications from unplanned site downtime
- **Mobility:** Help move your stateful applications and data across Kubernetes clusters for improved resiliency, with the ability to recover workloads in alternate Kubernetes environments
- **Efficiency:** Veritas delivers an intuitive and simple operating experience that extends Kubernetes functionality, giving you the performance and resiliency your enterprise applications need as a cloud-native solution

Veritas Alta Application Resiliency and Veritas Alta Shared Storage integrate seamlessly with Kubernetes, enabling you to easily deploy and manage persistent storage and resiliency for containerized applications and services. This helps ensure that your containerized applications have the foundation they need to be production ready. This document will provide an overview of the features and functionality of Veritas Alta Application Resiliency and Veritas Alta Shared Storage for Kubernetes.

## Solution Value

Veritas Alta Application Resiliency and Veritas Alta Shared Storage augment and extend Kubernetes by providing persistent storage for stateful containerized applications, and cluster-level resiliency that protects against local and site-wide outages. Veritas Alta Application Resiliency extends Kubernetes environments with:

- **Resiliency:** Achieve a near-zero recovery time objective (RTO)/recovery point objective (RPO) for mission critical applications with real-time namespace replication between Kubernetes clusters; integrated fencing technology ensures data integrity within Kubernetes clusters and can protect applications against unplanned downtime
- **Mobility:** With replication between Kubernetes clusters, easily move metadata and persistent data between environments, which helps eliminate lock-in and mitigates the effects of cloud service outages
- **Efficiency:** Easily configure high performance persistent shared storage in cloud networks using cloud block storage services with a cloud-native deployment architecture that optimizes operational efficiency and simplicity

Veritas Alta Application Resiliency and Veritas Alta Shared Storage are deployed as cloud-native containerized applications in a Kubernetes environment, making them easy to use with minimum time to value, while also providing a native user experience for Kubernetes administrators and architects.

## Solution Overview

As containers become more frequently deployed to serve a wider variety of use cases, Kubernetes environments will often include several different types of containerized applications, each with their own storage and resiliency requirements. Veritas Alta Application Resiliency and Veritas Alta Shared Storage have several unique features for Kubernetes environments that enable organizations to run important stateful applications in containers. Creating Kubernetes environments capable of supporting critical applications involves several challenges that cannot be resolved with cloud-native tools or services. Veritas Alta Application resiliency and Veritas Alta Shared Storage integrate with Kubernetes infrastructure to provide the resiliency and persistent storage your IT services need. Figure 1 shows an overview of the Veritas Alta Application Resiliency and Veritas Alta Shared Storage solution for Kubernetes.

## Application Resiliency

### Disaster Recovery (DR) for Kubernetes Clusters

Veritas Alta Application Resiliency includes a disaster recovery management solution for Kubernetes that can be deployed as an operator-based feature. The DR manager enables you to migrate and take over Kubernetes clusters for planned and unplanned recovery operations. Veritas Alta Application Resiliency manages the resiliency process with optimized replication between clusters that maintains write-order fidelity, and replicates application state and cluster metadata.

The DR manager is designed to protect your applications against site-wide outages, where an entire cluster may go offline—in planned and unplanned scenarios. The DR manager enables:

- **Resiliency:** Ensures that Kubernetes clusters are protected against site-wide outages with a full production ready DR environment; an advanced feature called Fire Drill allows you to non-disruptively test and validate that the applications in your DR site can be recovered and brought online in the event of a primary site failure
- **Mobility:** Disaster recovery can be configured using plans that allow for namespace granularity, which delivers the flexibility to provide resiliency for one or more applications, or full Kubernetes clusters
- **Efficiency:** Supports synchronous and asynchronous replication with optimized data transfer between sites; application uptime and operational efficiency can be optimized, with the ability to perform maintenance and administrative operations non-disruptively if system downtime is required

Figure 2 shows an overview of how the Veritas Alta Application Resiliency DR manager can be configured to provide resiliency for Kubernetes namespaces and clusters.

## Fencing Controller

Containerized applications that use Veritas Alta Shared Storage are automatically protected against data corruption due to a split-brain scenario. Split-brain can occur in any clustered environment in the event of a node/hardware failure that disrupts cluster communications and membership. Veritas Alta Shared Storage provides I/O fencing capability using a driver container dedicated to managing the fencing process. This prevents data from being written by nodes within the Kubernetes cluster that have failed due to hardware or network communication problems. If a node failure is detected by Kubernetes, the Veritas Alta Shared Storage fencing driver can ensure the persistent volumes being used by application pods on the failed node are no longer accessible by fencing this node out of the cluster. In the event of a communication loss between cluster nodes (aka worker nodes), the Veritas Alta Shared Storage fencing driver relays this information to the Kubernetes master which can then mark the node as failed, and move pods to another node.

Figure 3. Veritas Alta Shared Storage I/O fencing in Kubernetes helps ensure data integrity

## Shared Storage

### Container Storage Interface (CSI) Plug-In

Veritas Alta Shared Storage provides software-defined storage for Kubernetes environments using a CSI plug-in. This allows you to create Veritas Alta Shared Storage volumes using cloud-native block storage services that are managed by the integrated cluster volume manager and cluster file system. This storage is then presented to pods as persistent storage for your stateful containerized applications running in Kubernetes. Veritas Alta Shared Storage is transparent to the application, as the application pod is only aware that it is writing to a persistent volume claim (PVC) presented by Kubernetes. The CSI plug-in workflow is shown in Figure 4.

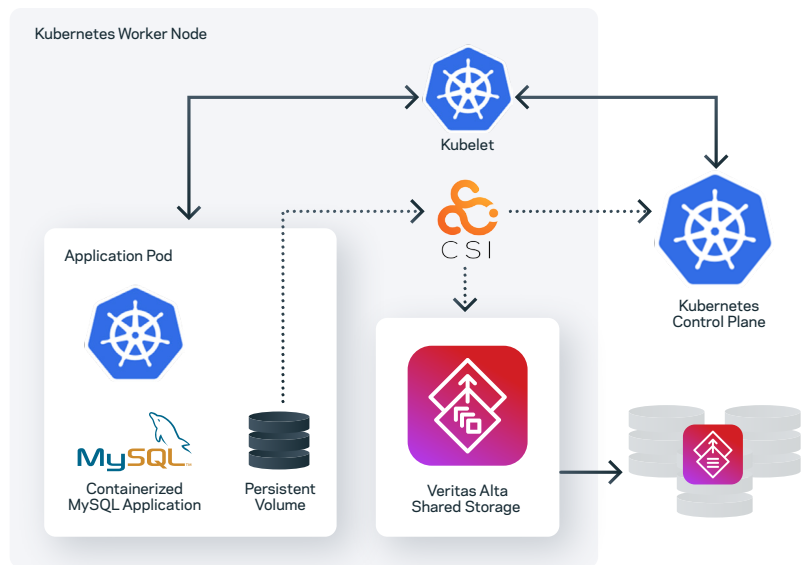

Figure 4. Veritas Alta Shared Storage CSI plug-in overview

## Persistent Volumes

Kubernetes storage classes are used to manage the attributes of Veritas Alta Shared Storage persistent volumes that are mounted by Kubernetes inside application pods using the InfoScale CSI plug-in. InfoScale provides several storage class configuration options that can be used to create persistent storage volumes. Storage classes are defined for performance, resiliency, and security, and can be customized to meet application requirements.

Veritas Alta Shared Storage persistent volumes are provisioned by Kubernetes using the Veritas Alta Shared Storage CSI plug-in either dynamically or statically:

- **Dynamic provisioning:** Volumes are created at the same time as the container and application pod using Kubernetes with the InfoScale CSI plug-in and InfoScale container installed; a Veritas Alta Shared Storage persistent volume claim binds the storage accessible to the application pods to the Veritas Alta Shared Storage persistent volume that is available to Kubernetes cluster nodes
- **Static provisioning:** Volumes are created within the Kubernetes cluster by directly accessing the Veritas Alta Shared Storage containers, creating a volume, and exposing this volume to containerized applications within the cluster; Veritas Alta Shared Storage statically provisioned volumes can also be used to simplify the process of migrating traditional applications into containers; application data volumes outside a Kubernetes cluster can be migrated to volumes within the cluster and then managed by Veritas Alta Shared Storage within the cluster using the InfoScale CSI plug-in; Veritas support should be contacted to help validate requirements and environmental variables involved in the migration process

Figure 5, below, shows how Veritas Alta Shared Storage persistent volumes and persistent volume snapshots are provisioned and used by application pods in a Kubernetes cluster.

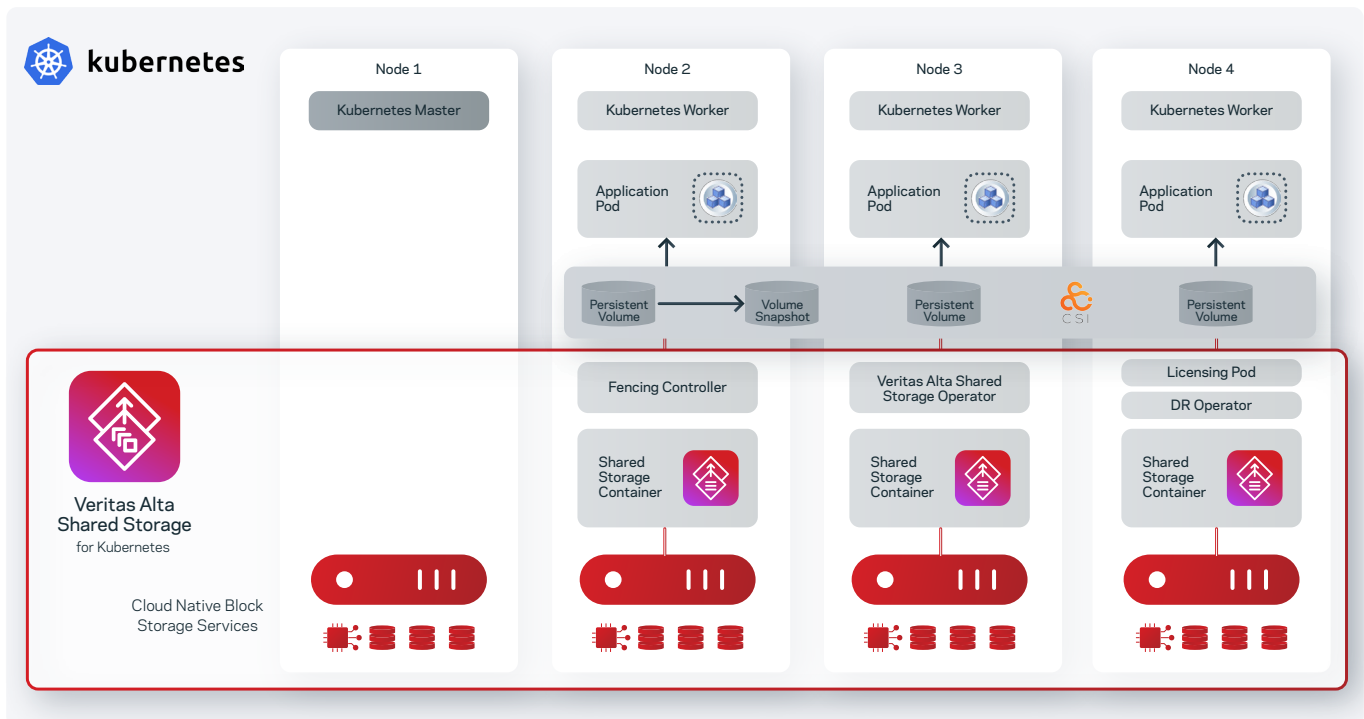

Figure 5. Veritas Alta Shared Storage persistent volumes and persistent volume snapshots

## Storage Management

Veritas Alta Shared Storage includes several advanced storage management features designed to support stateful enterprise workloads running in Kubernetes environments.

- **Data access:** Veritas Alta Shared Storage supports multiple access modes: ReadWriteOnce (RWO), ReadOnceMany (ROX), and ReadWriteMany (RWX), allowing you to provision storage more granularly, based on your application's requirements and operational standards
- **Encryption:** Available for workloads that require additional data security
- **Snapshots:** Create space-optimized copies of persistent volumes that can be provisioned statically or dynamically; can be used to reinstate volume contents on the original volume, or on a new persistent volume that you provision
- **Volume cloning:** Create an exact duplicate of a specified existing persistent volume; volume clones can be used by any persistent volume claim, and can be deleted without affecting the original volume

Figure 6 shows an overview of several use cases where Veritas Alta Shared Storage persistent volume snapshots are used to support multiple functions and services within an organization running stateful applications in Kubernetes.

Figure 6. Veritas Alta Shared Storage persistent volumes and persistent volume snapshots used for multiple purposes

## Conclusion

Digital transformation has driven enterprises toward IT solutions that provide better efficiency and scalability for their IT services. Containerizing applications and operating in a cloud-native model with Kubernetes can help businesses deliver more efficient innovation, but this operating model lacks some of the enterprise functionality needed by most applications. Veritas solves this problem by providing an enterprise-focused foundation with storage management and resiliency for Kubernetes that can operate at scale. This unique solution has several key benefits:

- ✓ **Resiliency:** Software-defined persistent storage for Kubernetes with advanced features designed to support enterprise IT service deployments
- ✓ **Mobility:** Enterprise-grade resiliency architecture that provides full disaster recovery and resiliency for Kubernetes clusters
- ✓ **Efficiency:** Optimize operations by eliminating point products and reducing overhead with a storage and resiliency solution that deploys as a cloud-native containerized application in Kubernetes

Veritas Alta Application Resiliency and Veritas Alta Shared Storage empowers businesses to deploy business-critical stateful applications in Kubernetes. This is achieved by integrating advanced storage management and resiliency for Kubernetes environments with cloud-native services. Designed for ease of use, flexibility, and scalability to support large container deployments, Veritas Alta Application Resiliency and Veritas Alta Shared Storage deliver an enterprise solution that provides the tools you need to run your applications in containers with maximum confidence.

## About Veritas

Veritas Technologies is a leader in multi-cloud data management. Over 80,000 customers—including 95 percent of the Fortune 100—rely on Veritas to help ensure the protection, recoverability, and compliance of their data. Veritas has a reputation for reliability at scale, which delivers the resilience its customers need against the disruptions threatened by cyberattacks, like ransomware. No other vendor is able to match the ability of Veritas to execute, with support for 800+ data sources, 100+ operating systems, 1,400+ storage targets, and 60+ clouds through a single, unified approach. Powered by Cloud Scale Technology, Veritas is delivering today on its strategy for Autonomous Data Management that reduces operational overhead while delivering greater value.
